

Mobile Wellness App – UX & Subscription Optimization

Timeline: 3+ months

Role: Product Designer

Team: BA, Development, QA, Stakeholders

1. Problem

The wellness app was in an early growth stage with functional features in place, but key UX layers were undermining its premium positioning and subscription performance.

Core issues identified:

- Low-resolution visuals reducing perceived trust and product credibility
- Inconsistent image scaling across devices causing layout imbalance
- Weak or non-engaging loading states
- Abrupt and poorly structured end-of-trial experience
- Invite flow lacking CTA clarity and hierarchy

While subtle, these friction points directly impacted:

- Perceived product quality
- Engagement continuity
- Retention
- Trial-to-paid conversion

The core problem was not missing functionality: it was experience-level friction at high-impact touchpoints.

2. Constraints

- Early-stage product (limited time and resources)
- No full redesign scope
- Existing mobile architecture and layout structure
- Performance limitations on mobile devices
- Subscription model already implemented
- Need to deliver development-ready assets quickly

The improvements had to be high-impact, lightweight, and technically feasible.

3. Hypothesis

If we:

- Improve visual asset quality and consistency
- Enhance engagement during waiting states
- Clarify social invite flows
- Redesign the trial-end conversion moment

Then we could:

- Increase perceived credibility
- Improve user patience during processing

- Strengthen emotional reinforcement at churn risk
- Improve clarity of subscription value
- Support higher trial-to-paid conversion

The strategy focused on optimizing critical experience moments rather than broad system redesign.

4. Design Decisions

A. Visual System Upgrade

Objective: Improve credibility and consistency across devices.

Actions taken:

- Replaced low-resolution background images
- Standardized asset scaling for multiple mobile resolutions
- Removed inconsistent backgrounds
- Converted assets to optimized transparent PNG formats
- Cleaned and processed 77+ UI method images
- Refined diet-related visuals

Impact:

- Improved visual consistency across devices
- Reduced layout imbalance
- Increased perceived professionalism
- Maintained performance efficiency

B. Micro-Interaction Enhancement

Problem: Loading states lacked engagement and felt static.

Solution:

- Designed branded loading animation
- Balanced animation weight with mobile performance
- Reinforced brand personality during wait states

Static	Branded Animation
Passive	Engaging
No brand reinforcement	Brand presence
Feels slow	Feels intentional

UX Rationale:

Engaging micro-interactions reduce perceived wait time and improve user patience.

C. Invite Flow Optimization

Refined:

- Layout hierarchy
- CTA prominence
- Spacing and visual balance

Objective:

Make social engagement more intuitive and frictionless, increasing likelihood of invite actions.

D. Trial-End & Subscription Conversion Redesign

This was the most strategically impactful intervention.

Problem:

The trial period ended abruptly with weak reinforcement of subscription value.

Design Improvements:

- Redesigned end-of-trial screen
- Structured subscription messaging
- Reinforced value delivered during trial
- Added feedback collection mechanism

- Improved CTA hierarchy and clarity

UX Focus:

- Reduce churn at the conversion moment
- Provide emotional reinforcement
- Offer a clear next step
- Capture actionable insights from non-converting users

5. Tradeoffs

- Focused on high-impact touchpoints rather than full UI overhaul
- Prioritized asset refinement over layout restructuring
- Balanced animation engagement with performance constraints
- Optimized within existing architecture instead of redesigning flows entirely

The strategy emphasized incremental but meaningful improvements aligned with product maturity.

6. Outcome

Over 3+ months, the UX optimizations resulted in:

- Increased perceived product quality
- Improved visual consistency across devices
- More engaging loading experience
- Cleaner asset management system
- Clearer trial-to-subscription transition
- Improved structural clarity at churn-risk moment

Even without large-scale redesign, targeted UX enhancements strengthened user perception, engagement continuity, and subscription pathways.

7. Key Learnings

- Perceived credibility directly impacts subscription-based products.
- Small visual inconsistencies can significantly reduce trust.
- Micro-interactions influence perceived performance more than raw speed.
- Conversion moments require emotional reinforcement, not just functional CTAs.
- Early-stage products benefit most from high-leverage UX optimizations.
- Asset standardization improves both scalability and development efficiency.
- Strategic refinement can deliver meaningful impact without full redesign.
